

Complex Analysis Homework 1

Colin Wilkes
Dr. Ikhutsyeva
MATH 630

1.) Show that:

a) $\operatorname{Re}(iz) = -\operatorname{Im}(z)$

Proof

Let $z = x + iy \in \mathbb{C}$

$$\Rightarrow iz = ix - y$$

$$\Rightarrow \operatorname{Re}(iz) = -y$$

On the other hand, $\operatorname{Im}(z) = y$

Thus, $\operatorname{Re}(iz) = -y = -\operatorname{Im}(z)$

$$\Rightarrow \operatorname{Re}(iz) = -\operatorname{Im}(z) \quad \blacksquare$$

b) $\operatorname{Im}(iz) = \operatorname{Re}(z)$

Proof

Again, let $z = x + iy \in \mathbb{C}$

$$\Rightarrow iz = ix - y$$

$$\Rightarrow \operatorname{Im}(iz) = x$$

On the other hand, $\operatorname{Re}(z) = x$

Thus, $\operatorname{Im}(iz) = x = \operatorname{Re}(z)$

$$\Rightarrow \operatorname{Im}(iz) = \operatorname{Re}(z) \quad \blacksquare$$
